VOR RECEIVER CHECK SIGNALS

Provisions are being made to provide pilots with a means of checking the accuracy of VOR receivers to insure satisfactory operations of the airborne system. These provisions consist of three different methods; (a) a radiated test signal consisting of a signal radial; (b) certified check points on the airport surface; or (c) certified airborne check points. The radiated test signal is used by tuning the receiver to the published frequency of the test facility. With the flight path deviation indicator(FPDi) centered, the omnibearing selector should read 0° with the to-from indication being "From"; or the omnibearing selector should read 180° with the to-from indication reading "To". Should the VOR receiver be of the automatic indicating type the indication should be 180°." (This is true for all airborne receivers except Mitchell which will indicate 0°). Two means of identification are used with the VOR radiated test signal. In some cases, a continuous series of dots is used while in others a continuous 1020 cycle tone will identify the test signal. Information as to identification of an indivisual test signal can be obtained from the local control tower. Ground and airborne check points consist of certified radials that should be received at specific points on the airport surface or over specific landmarks while airborne in the immediate vicinity of the airport. Pilots are requested to contact control tower, communication station or airport manager for location details. Should an error in excess of +4° be indicated through use of the ground check or ± 6° using the airborne check, IFR flight should not be attempted without first correcting the source of error. CAUTION, no correction other than the "correction card" figures supplied by the manufacturer should be applied in making these VOR receiver checks. As of this date check points or facilities have been established at the following airports (listed under city name).

Attention, Pilots!

CHECK YOUR AERONAUTICAL CHARTS AND MAKE SURE THAT EACH OF THE OBSTRUCTIONS LISTED BELOW IS CARRIED!
IF ANY ARE MISSING, INSERT THEM NOW, DON'T DELAY! ONLY YOU CAN MARK YOUR CHARTS: IT IS YOUR RESPONSIBILITY!

This list covers recent obstructions (television towers, smoke stacks, etc) which are 500 feet or more above the ground. It will be carried in the Airman's Guide at frequent intervals. When the list does not appear in the Guide, all new obstructions will be carried as two-starred items in the NOTAMS. The list will be brought up to date each time it is issued; newly added or changed material will be indicated by arrows.

The Coast and Geodetic Survey sectional charts show all known dangerous obstructions at the time a particular chart is issued. As these charts are published at intervals of six months to a year, dangerous obstructions built during the interim between issues must be placed on the charts by the user. The position, height and top elevation above MSL of these new obstructions can be taken from the list given below. New obstructions will be carried in this list until six months after the issuance of the sectional charts depicting the obstruction data and then deleted.

RADAR PROCEDURES

If a radar instrument approach is conducted at the below named airport, it shall be in accordance with the following instrument procedure, unless an approach is conducted in accordance with a different procedure for such airport authorized by the Administrator of Civil Aeronautics. Initial approaches shall be made over specified routes. Minimum altitude (s) shall correspond with those established for en route operation in the particular area or as set forth below. Positive identification must be established with the radar controller. From initial contact with radar to final authorized landing minimums the instructions of the radar controller are mandatory except when (A) visual contact is established on final approach at or before descent to the authorized landing minimums, or (B) at pilot's discretion if it appears desirable to discontinue the approach. Except when the radar controller may direct otherwise prior to final approach, a missed approach shall be executed as provided below when (A) communication on final approach is lost for more than 5 seconds during a precision approach or, for more than 30 seconds during a surveillance approach; (B) directed by radar controller; (C) visual contact is not established upon descent to authorized landing minimums; or (D) if landing is not accomplished.

VHF OMNIRANGE (TVOR) PROCEDURES

If a TVOR instrument approach is conducted at the below named airport, it shall be in accordance with the following instrument approach procedure, unless an approach is conducted in accordance with a different procedure for such airport authorized by the Administrator of Civil Aeronautics. Initial approaches shall be made over specified routes. Minimum altitude (s) shall correspond with those established for en route operation in the particular area or as set forth below.

SPECIAL NOTICES

✓ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the General Services Office, Attention: W-120 (formerly W-52), CAA, Washington 25, D. C.

Permanent airport data changes should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman's Guide

---

CIVIL USE OF MILITARY FIELDS: U. S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission.

In the case of Air Force Bases, pilots must have on file with Headquarters USAF a "HOLD HARMLESS" AF form 180 and in their possession a properly signed and executed AF form 181 permit. Application for these forms may be made to: Assistant Chief of Staff, Installations, HQ, USAF, Washington 25, D. C. This regulation will be strictly enforced.

For Naval Installations, prior permission should be requested from the Chief of Naval Operations (OP 532) via the Commanding Officer of the field concerned, (who has the authority to approve landing rights for certain categories of civil aircraft). However, with minor exceptions, authority to use Navy field is granted only to aircraft on government business, or when no suitable civil airport is available in the vicinity.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations. The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shut down, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical locations. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert for these apparent vagaries.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations).

Omniranges where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification:

e.g. Long Beach omnirange — (Voice) — (LGB in Code)

For omniranges, as shown above, normal voice identification consists of the name of the omni followed by the word "omni". However, if the omni is unattended, i.e. if no facility for providing air-ground communications services is associated with the omni the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciably higher rate of speed than the location identifier.

INTERFERENCE ON INSACS COMMUNICATIONS CHANNELS: If excessive interference is noted on INSACS VFR or UHF simplex frequencies, pilots should request the INSACS to reply on the VOR voice channel. (Reference to the Air Navigation Radio Aids Section will indicate which VORs have a voice channel). This will often expedite the exchange of messages as the VOR has a clear channel for communications.

FLIGHT IN RESTRICTED AREA: Pilots are responsible for obtaining an approval from the appropriate controlling agency prior to conducting flight in Restricted Areas, when governing restrictions are in effect. ATC is unable, because of communications workload and other factors, to obtain such approval for pilots. An ATC clearance should not be considered as authority to conduct flight in Restricted Areas EXCEPT where a control area overlays a Restricted Area as ATC has responsibility only within controlled airspace.

✓ NOMENCLATURE CHANGES FOR INSACS AND OFACS: Effective immediately the following nomenclature changes are in effect:

"Interstate Airway Communications Station" (INSACS) will be replaced by "Air Traffic Communications Station" (ATCS).

"Overseas-Foreign Aeronautical Communications Station" (OFACS) will be replaced by "International Air Traffic Communications Station" (IATCS).

Since the new abbreviations are not phonetic, the short terms "Station" and "International Station" may be used when referring to these facilities.

FLIGHT PLANS: Pilots are urged to file VFR flight plans in person or by telephone prior to departure. Radio should be used for filing flight plans only when it is impossible to file in person or by telephone. This procedure is necessary in order to avoid congestion on the already busy air-ground communications channels. These channels should be reserved for essential in-flight communications. All pilots will benefit by following this practice.

DVFR FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

RUNWAY VISUAL RANGE REPORTS AT NEWARK, N. J.: Effective March 3, 1956, measurements of runway visibility for Runway 4 at Newark, New Jersey, will be in terms of Runway Visual Range which is the distance high intensity runway lights can be seen by an observer located at the runway threshold viewing the lights in the same direction as a pilot making an approach.

The ILS and PAR instrument approach procedures for Newark will be amended to authorize 2600' of runway visual range as an additional operating minimum for straight-in approaches to Runway 4. When measurements of Runway Visual Range are being taken, the tower will give pilots intending to land straight-in on runway 4, the reported Runway Visual Range. When the meteorological ceiling and visibility (contained in "main body" of sequence report which is the average weather for the airport proper) are reported below minimums, (e.g. 200.5), an approach may be conducted to Runway 4 provided Runway Visual Range is reported at or above 2600'. The "remarks" portion of the hourly weather sequence for Newark will report Runway Visual Range in hundreds of feet, and runway visibility will no longer be reported in miles and fraction.

Since Runway Visual Range recognizes the additional penetration provided by high intensity runway lights and is measured in terms of what a pilot actually sees, pilots will have better assurance of finding runway conditions substantially as reported when arriving over the threshold.

The Runway Visual Range minimum of 2600' is also based on the penetration ability of the approach lighting system installed at Newark which is designed to assure earlier transition from instrument to visual flight.

GLIDE SLOPE FLARE: Modification of null reference glide slope facilities will result in glide slope flare at about thirty (30) feet above runway. Caution advised on automatic approaches continued past runway threshold.

POSITION REPORTING PROCEDURE FOR IFR FLIGHTS OPERATING AT LEAST 1000 FEET ON TOP: Effective September 15, 1956, IFR flights cleared by ATC to operate at least 1000 feet on top shall conform to the following position reporting procedures:

1. Flights along airways. Regardless of the altitude being flown, pilots shall report only over those fixes that are designated as compulsory reporting points for all altitudes. ATC may specify additional reports as required.

2. Flights operating on a direct route. Regardless of the altitude being flown, pilots shall report over each reporting point specified in the flight plan (approximately 200 miles apart) and over each fix along the route designated as a compulsory reporting point for all altitudes. ATC may specify additional reports as required.

Pilots filing direct route flight plans requesting an altitude of at least 1000 feet on top should designate the route flight by appropriate fixes approximately 200 miles apart over which they plan to report.

IFR RATE OF CLIMB OR DESCENT: In the interest of standardizing operating procedures for IFR flight and to provide greater utilization of available airspace, pilots are requested to adhere to the following procedure when cleared by air traffic control to climb or descend in excess of 1000 feet to an approved altitude:

1. Unless cleared otherwise by air traffic control, climb as rapidly as practicable to 1000 feet below the assigned altitude and then not to exceed 500 feet per minute until the assigned altitude is reached.

2. Unless cleared otherwise by air traffic control, descend as rapidly as practicable to 1000 feet above the assigned altitude and then not to exceed 500 feet per minute until the assigned altitude is reached.

ATC DEPARTURE CLEARANCES: Effective November 1, 1956, air traffic controllers will discontinue issuing departure clearances specifying that any portion of the departure shall be conducted in "VFR conditions" unless provision of positive separation will result in an excessive departure delay and the pilot indicates that he will accept a VFR restriction. To reduce communications and expedite departures wherever possible, pilots should include in their requests for departure clearances a statement that they will accept a VFR restriction either during climb to cruising altitude or to a specified altitude.

CIVIL AIRWAY, CONTROL AREA, CONTROL AREA EXTENSION, CONTROL ZONE AND REPORTING POINT AMENDMENTS: Effective December 13, 1956, unless otherwise advised the following civil airways, control areas, control area extensions, control zones and reporting points are amended in whole or in part as follows:

CIVIL AIRWAYS: (1) Green civil airway No. 5 (Los Angeles, Calif. to Boston, Mass), is amended by changing the last portion which reads: "the intsxn of the NE course of the Mitchel AFB, N.Y., rdo rng and the SW course of the Boston, Mass. rdo rng to the intsxn of the SW course of the Boston, Mass. rdo rng and the SE course of the Westfield, Mass. rdo rng." to read: "the intsxn of the NE course of the Mitchel AFB, N.Y. rdo rng and the SW course of the Boston, Mass. rdo rng to the Boston, Mass. rdo rng stn." (Note: Due to relocation of Westfield rng stn; Green 5 now overlaps Green 2 between Moosup intsxn and Boston)

(2) Amber civil airway No. 1 (United States-Mexican Border to Nome, Alaska), is amended by changing the portion which reads: "excluding the airspace which overlaps Albert Head restricted area (R-407)." to read: "excluding the airspace lying more than 2 miles W of and parallel to the S course of the Patricia Bay, B.C. rdo rng between the intsxn of the NW course of the Seattle, Wash. rdo rng with the S course of the Patricia Bay, B.C. rdo rng and the U.S.-Canadian Border." and is amended between Anchorage and Skwentna, Alaska, to read: "Anchorage, Alaska rdo rng stn; the intsxn of the NW course of the Anchorage, Alaska, rdo rng and the SE course of the Skwentna, Alaska rdo rng; Skwentna, Alaska, rdo rng stn." (Note: A. Re narrowing Amber 1 at border N of Seattle, Canadian D.O.T. narrowing their portion effective December 1, 1956, between Dungeness FM and Gordon Head NDB, and their D.O.T. danger area is being amended to be bounded on the E by the western side of the narrowed airway. B. Re change between Anchorage and Skwentna, Anchorage LF rng being relocated to site at lat 61-07-43, long. 149-57-16, with courses: NE course 206° T toward stn (over Wasilla). SE course 302°T toward stn (on Whittier intsxn) SW course 29°T toward the stn (on Homer rng). NW course 151°T toward stn (on McDougal intsxn) with 3700 ft. MEA Susitna to McDougal intsxn.)

(3) Blue civil airway No. 61 (Springfield, Mo. to Kansas City, Mo.), is revoked.

(4) VOR civil airway No. 5 (Miami, Fla. to London, Ont.), is amended by changing all after the Cincinnati, Ohio omnirng stn to read: "Cincinnati, Ohio omnirng stn, including an E alternate; intsxn of the Cincinnati omnirng 45°T and the Appleton omnirng 244°T radials; Appleton, Ohio omnirng stn; Mansfield, Ohio omnirng stn, including an E alternate from the Appleton omnirng stn to the Mansfield omnirng stn via the intsxn of the Appleton omnirng 050°T and the Mansfield omnirng 173°T radials; Cleveland, Ohio omnirng stn; to the London, Ont. omnirng stn. Those portions of this arwy which overlap the Jacksonville restricted area (R-161), the Lake George restricted area (R-176) and the Sterling restricted areas (R-169) and (R-170) are excluded." (Note: Redesignated V5 to replace Columbus, Ohio VOR with Appleton, Ohio VOR.)

(5) VOR civil airway No. 7 (Miami, Fla. to Green Bay, Wis.), is amended by changing the portion which reads: "Montgomery, Ala. omnirng stn; Birmingham, Ala. omnirng stn, including an E alternate via the intsxn of the Montgomery omnirng 358°T and the Birmingham omnirng 138°T radials and also a W alternate; intsxn of the Birmingham omnirng 358°T and the Muscle Shoals omnirng 129°T radials; Muscle Shoals, Ala. omnirng stn;" to read: "Montgomery, Ala. omnirng stn; Birmingham, Ala. omnirng stn, including a W alternate via the intsxn of the Montgomery omnirng 326°T and the Birmingham omnirng 180°T radials; Muscle Shoals, Ala. omnirng stn;" (Note: Redesignated V7 between Montgomery VOR and Muscle Shoals VOR. Redesignated V7W between Montgomery VOR and Birmingham VOR. Revoked V7E between Montgomery VOR and Birmingham VOR.)

(6) VOR civil airway No. 8 (Long Beach, Calif. to Washington, D.C.), is amended by changing the portion which reads: "Bryce Canyon, Utah, omnirng stn; Hanksville, Utah omnirng stn; Grand Junction, Colo. omnirng stn;" to read: "Bryce Canyon, Utah omnirng stn, including a S alternate; Hanksville, Utah omnirng stn, including a S alternate; Grand Junction, Colo. omnirng stn, including a S alternate;" (Note: Added S alternates from Mormon Mesa to Bryce Canyon to Hanksville to Grand Junction VORs).

(7) VOR civil airway No. 10 (Pueblo, Colo. to New York, N.Y.), is amended by changing the portion which reads: "Carleton, Mich. omnirng stn; Perry, Ohio nondirectional rdo bcn; Youngstown, Ohio omnirng stn;" to read: "Carleton, Mich. omnirng stn; point of intsxn of the Jefferson, Ohio omnirng 279°T and the Youngstown omnirng 320°T radials; Youngstown, Ohio omnirng stn;" (Note: Redesignated V10 via the North Perry Intsxn between Carleton VOR and Youngstown VOR.)

(8) VOR civil airway No. 12 (Santa Barbara, Calif. to Philadelphia, Pa.), is amended by changing the portion which reads: "Albuquerque, N. Mex. omnirng stn;" to read: "Albuquerque, N. Mex. omnirng stn, including a S alternate from the Zuni, N. Mex. omnirng stn to the Albuquerque, N. ✓ NAVAL AIR MANEUVERS: U. S. Navy conducting extensive air maneuvers surface to 40,000 ft, November 120500Z to November 151200Z, in following area:

Area bounded by 30-00N, 77-00W to 32-12N, 77-00W to 35-00N, 73-00W to 37-00N, 73-00W to 37-00N, 68-00W to 32-00N, 68-00W to 30-00N, 77-00W.

U.S. Navy will have blanket approval to operate in the entire area. Except when non-participating aircraft are in transit CAA will issue routine IFR clearances to all transiting flights and Navy will avoid those areas and altitudes occupied by the non-participating aircraft. Navy will have flight plans on all non-participating aircraft, will monitor enroute air-ground frequencies and will provide a minimum of ten (10) miles radar separation between maneuver and non-participating aircraft when lateral separation necessary.

RADAR PROCEDURES

If a radar instrument approach is conducted at the below named airport, it shall be in accordance with the following instrument procedure, unless an approach is conducted in accordance with a different procedure for such airport authorized by the Administrator of Civil Aeronautics. Initial approaches shall be made over specified routes. Minimum altitude (s) shall correspond with those established for en route operation in the particular area or as set forth below. Positive identification must be established with the radar controller. From initial contact with radar to final authorized landing minimums the instructions of the radar controller are mandatory except when (A) visual contact is established on final approach at or before descent to the authorized landing minimums, or (B) at pilot's discretion if it appears desirable to discontinue the approach. Except when the radar controller may direct otherwise prior to final approach, a missed approach shall be executed as provided below when (A) communication on final approach is lost for more than 5 seconds during a precision approach or, for more than 30 seconds during a surveillance approach; (B) directed by radar controller; (C) visual contact is not established upon descent to authorized landing minimums; or (D) if landing is not accomplished.

ALWAYS CHECK NOTICES TO AIRMEN SECTION

ATCS = Air Traffic Communications Station (CAA)

VHF OMNI-RANGE: "Non-commissioned" VHF omni-ranges may lack certain items, such as monitoring or control equipment or may not have been flight-checked and are subject to shut-down at any time without notice. The courses may or may not be within the prescribed tolerances and the station is to be used accordingly.

VAR AND VOR MONITORING CLASSIFICATION FOR AIR TRAFFIC CONTROL PURPOSES: Category I (VAR) = Following conditions must be met: (A) The visual course alignment and signal level are monitored continuously. (B) The aural "A" or "N" sector signal is monitored continuously by the communicator at the associated ATCS. (C) The station identification is monitored continuously by the communicator at the associated ATCS. (D) The aural course alignment is monitored at least once each hour by the communicator at the associated ATCS. Category I (VOR) = Course alignment and signal level are monitored continuously. NOTE: Category I indicated by parenthetical (1). Category II (VAR only) = If all except (D) of the conditions of Category I are met. NOTE: Category II indicated by parenthetical (2). Category III = Facility monitored soley through use of automatic visual course and signal level monitor with automatic transfer unit. This category may permit VOR to be inoperative for a limited period before a notice to airmen is issued. Normally, VHF ranges which are not controlled by an ATCS, and located too distant from ATCS to be monitored with a VHF receiver will fall into Category III. NOTE: Category III indicated by parenthetical (3).

NOTE: Letters between range courses are quadrant identifiers, e.g., "90 YN 180", indicates the quadrant between the two courses is a yellow N quadrant. The letter immediately following a range course indicates whether the course is aural or visual, i.e., "Y" or "B", for yellow or blue, indicates visual: "A" or "N" aural. In the case of low frequency ranges, the A or N cited between two courses is the identification to be heard in the quadrant between those two courses.

RL. . . . . Range (loop radiators), power 150 watts or more
S. . . . . Simultaneous range, homing signals and voice.
T . . . . . Teletype
TASR . . . Terminal Area Surveillance Radar
TVOR. . . Low power VOR (no standby equipment) located on airport
TX. . . . . Principal teletype
V. . . . . Additional VHF voice feature on other than range frequency
VAR. . . . Visual-aural VHF range
VOR. . . . VHF omni-directional range (omni-range)
W. . . . . Without voice facilities on range frequency
Z. . . . . VHF station location marker at a range station

NOTES

1. **Range courses are magnetic in-bearings**
2. **All CAA MH facilities operate continuously unless cited as follows: (on req)**
3. **All CAA ranges operate continuously. Those which are not manned continuously are cited in the remarks column with hours of operation in parentheses, e.g., (0600-2400)**
4. **VHF and LF/LMF ranges listed with the same identifier are controlled by the same ATCS. Due to space limitations the DTV and communication frequencies which are listed with the LF/LMF facility are not repeated with the VOR facility**

Pilots are requested to indicate when calling C.A.A. airway communications stations and control towers the frequency on which the reply is expected.

RADAR AVAILABLE : How and Where

(27 Nov 1956)

PAR = Precision Approach Radar. ASR = Airport Surveillance Radar. GCA = Ground Controlled Approach - Military Equivalent of Combined ASR and PAR Equipment. TASR = Terminal Area Surveillance Radar. RAPCON = Radar Approach Control Center.

GROUND CONTROLLED APPROACHES - The only airborne equipment required for ground controlled approaches is a functioning radio transmitter and receiver. There are two types of ground controlled approaches - Precision and Surveillance.

PRECISION APPROACHES - Aircraft are guided to final approach to the designated instrument runway. The final approach flight path on a precision scope (PAR) is greatly expanded for increased accuracy and furnishes the controller with range, azimuth and altitude information. This permits the controller to accurately guide aircraft to touchdown on the runway.

SURVEILLANCE or ASR APPROACHES - Only the ASR scope is used and aircraft may be directed to any selected runway over approximately the same flight path the pilot would take if flying VFR. This scope furnishes range and azimuth information only. Since no altitude information is available to the controller, pilots must control their descent based on the glide angle desired, and the distance from the runway as furnished by the controller. Because ASR does not permit the same degree of accuracy as PAR, the weather minimums for a surveillance approach are usually higher than for a precision approach.

RADAR ARRIVAL AND DEPARTURE CONTROL - Radar is utilized by certain radar equipped facilities to control the flight paths of arriving or departing IFR aircraft for the purpose of expediting the flow of traffic. Aircraft operating on IFR flight plans will be afforded a minimum of three miles horizontal separation unless standard non-radar vertical, lateral or longitudinal separation exists. This should not be confused with Ground Controlled Approach (GCA) which is an instrument approach aid.

CAA RADAR UNITS - Operate continuously at the locations listed. Available to all pilots, civil and military. Contact associated CAA control tower on any frequency guarded for initial instructions, or in an emergency any CAA facility for information on nearest Radar Control. Weather minimums, associated runways and GCA procedures are listed in the Airman's Guide.

RAPCON - At certain locations, the surveillance portion of Military RAPCONS is operated by the CAA and service is available to all aircraft. These are listed below.

AIR FORCE AND NAVY GCA UNITS - Available to civil pilots in emergency or by prior arrangement with C.O. of respective facility.
Contact under IFR: Pilots desiring GCA assistance during IFR conditions should call the nearest air traffic control facility (radio, airways, or tower, etc.) requesting GCA and further instructions.
Contact under VFR: VFR check-out of training flights should be arranged locally through Base Operations or the Control Tower.
Emergency: When receiver or transmitter difficulties exist, the tower may relay GCA approach instructions to the pilot, or the GCA operator may transmit, in blind, instructions for aircraft to make 360 degree turns for identification. In either case, instructions will be followed at the pilot's discretion. After being inoperative, GCA units require 20 to 30 minutes for warming up. Pilots shoud anticipate requirements for GCA in flight planning and request alerting of GCA units as far in advance as possible Civil Minimums at military installations established by the CAA are 400' ceiling and 1 statute mile visibility except in emergency unless Air Force or Navy facility being used has higher minimums. Navy units are prepared to transmit on HF from 2,000 to 18,000 kc and receive any frequency from 1,500 to 9,050 kc to aid any plane in emergency.

RADAR FLIGHT ADVISORY SERVICE: If radar advisory service is desired, the pilot of an aircraft will request such service through the appropriate Air Route Traffic Control Center, using normal en route communications facilities. ARTC will determine if service can be provided and will request pilot to change to appropriate frequency for direct communication with radar. Radar station will be identified by "THIS IS AIR FORCE RADAR ADVISORY". All suggested vectors to circumnavigate storm areas will be of advisory nature and do not relieve pilot of responsibility for safety of aircraft. If advisory service cannot be furnished for any reason, the procedure word "UNABLE" will be used. This will terminate radar advisory service to the aircraft without further explanation. This service will be available in the following ARTC Flight Advisory Areas; Chicago, St. Louis, Minneapolis, Kansas City, Albuquerque, San Antonio, Ft. Worth, Oakland, Denver, Great Falls, Los Angeles, and the area immediately around Knoxville, Tenn.

NOTE: Transmitting frequencies below 118 mc. are not guarded. Other transmitting frequencies listed are guarded plus 122.5 mc. and 3023.5 kc. Transmit and guard 121.5 mc. all locations.

✓ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the General Services Office, Attention: W-120 (formerly W-52), CAA, Washington 25, D. C.

Permanent airport data changes should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman's Guide

---

CIVIL USE OF MILITARY FIELDS: U. S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission.

In the case of Air Force Bases, pilots must have on file with Headquarters USAF a "HOLD HARMLESS" AF form 180 and in their possession a properly signed and executed AF form 181 permit. Application for these forms may be made to: Assistant Chief of Staff, Installations, HQ, USAF, Washington 25, D. C. This regulation will be strictly enforced.

For Naval Installations, prior permission should be requested from the Chief of Naval Operations (OP 532) via the Commanding Officer of the field concerned, (who has the authority to approve landing rights for certain categories of civil aircraft). However, with minor exceptions, authority to use Navy field is granted only to aircraft on government business, or when no suitable civil airport is available in the vicinity.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations. The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shut down, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical locations. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert for these apparent vagaries.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations).

Omniranges where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification:

e.g. Long Beach omnirange (Voice) .-.. .- -.-. ... (LGB in Code)

For omniranges, as shown above, normal voice identification consists of the name of the omni followed by the word "omni". However, if the omni is unattended, i.e. if no facility for providing air-ground communications services is associated with the omni the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciable higher rate of speed than the location identifier.

INTERFERENCE ON INSACS COMMUNICATIONS CHANNELS: If excessive interference is noted on INSACS VFR or UHF simplex frequencies, pilots should request the INSACS to reply on the VOR voice channel. (Reference to the Air Navigation Radio Aids Section will indicate which VORs have a voice channel). This will often expedite the exchange of messages as the VOR has a clear channel for communications.

FLIGHT IN RESTRICTED AREA: Pilots are responsible for obtaining an approval from the appropriate controlling agency prior to conducting flight in Restricted Areas, when governing restrictions are in effect. ATC is unable, because of communications workload and other factors, to obtain such approval for pilots. An ATC clearance should not be considered as authority to conduct flight in Restricted Areas EXCEPT where a control area overlays a Restricted Area as ATC has responsibility only within controlled airspace.

NOMENCLATURE CHANGES FOR INSACS AND OFACS: Effective immediately the following nomenclature changes are in effect:

"Interstate Airway Communications Station" (INSACS) will be replaced by "Air Traffic Communications Station" (ATCS).

"Overseas-Foreign Aeronautical Communications Station" (OFACS) will be replaced by "International Air Traffic Communications Station" (IATCS).

Since the new abbreviations are not phonetic, the short terms "Station" and "International Station" may be used when referring to these facilities.

FLIGHT PLANS: Pilots are urged to file VFR flight plans in person or by telephone prior to departure. Radio should be used for filing flight plans only when it is impossible to file in person or by telephone. This procedure is necessary in order to avoid congestion on the already busy air-ground communications channels. These channels should be reserved for essential in-flight communications. All pilots will benefit by following this practice.

DVFR FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

RUNWAY VISUAL RANGE REPORTS AT NEWARK, N. J.: Effective March 3, 1956, measurements of runway visibility for Runway 4 at Newark, New Jersey, will be in terms of Runway Visual Range which is the distance high intensity runway lights can be seen by an observer located at the runway threshold viewing the lights in the same direction as a pilot making an approach.

The ILS and PAR instrument approach procedures for Newark will be amended to authorize 2600' of runway visual range as an additional operating minimum for straight-in approaches to Runway 4. When measurements of Runway Visual Range are being taken, the tower will give pilots intending to land straight-in on runway 4, the reported Runway Visual Range. When the meteorological ceiling and visibility (contained in "main body" of sequence report which is the average weather for the airport proper) are reported below minimums, (e.g. 200.5), an approach may be conducted to Runway 4 provided Runway Visual Range is reported at or above 2600'. The "remarks" portion of the hourly weather sequence for Newark will report Runway Visual Range in hundreds of feet, and runway visibility will no longer be reported in miles and fraction.

Since Runway Visual Range recognizes the additional penetration provided by high intensity runway lights and is measured in terms of what a pilot actually sees, pilots will have better assurance of finding runway conditions substantially as reported when arriving over the threshold.

The Runway Visual Range minimum of 2600' is also based on the penetration ability of the approach lighting system installed at Newark which is designed to assure earlier transition from instrument to visual flight.

GLIDE SLOPE FLARE: Modification of null reference glide slope facilities will result in glide slope flare at about thirty (30) feet above runway. Caution advised on automatic approaches continued past runway threshold.

POSITION REPORTING PROCEDURE FOR IFR FLIGHTS OPERATING AT LEAST 1000 FEET ON TOP: Effective September 15, 1956, IFR flights cleared by ATC to operate at least 1000 feet on top shall conform to the following position reporting procedures:

1. Flights along airways. Regardless of the altitude being flown, pilots shall report only over those fixes that are designated as compulsory reporting points for all altitudes. ATC may specify additional reports as required.

2. Flights operating on a direct route. Regardless of the altitude being flown, pilots shall report over each reporting point specified in the flight plan (approximately 200 miles apart) and over each fix along the route designated as a compulsory reporting point for all altitudes. ATC may specify additional reports as required.

Pilots filing direct route flight plans requesting an altitude of at least 1000 feet on top should designate the route flight by appropriate fixes approximately 200 miles apart over which they plan to report.

IFR RATE OF CLIMB OR DESCENT: In the interest of standardizing operating procedures for IFR flight and to provide greater utilization of available airspace, pilots are requested to adhere to the following procedure when cleared by air traffic control to climb or descend in excess of 1000 feet to an approved altitude:

1. Unless cleared otherwise by air traffic control, climb as rapidly as practicable to 1000 feet below the assigned altitude and then not to exceed 500 feet per minute until the assigned altitude is reached.

2. Unless cleared otherwise by air traffic control, descend as rapidly as practicable to 1000 feet above the assigned altitude and then not to exceed 500 feet per minute until the assigned altitude is reached.

ATC DEPARTURE CLEARANCES: Effective November 1, 1956, air traffic controllers will discontinue issuing departure clearances specifying that any portion of the departure shall be conducted in "VFR conditions" unless provision of positive separation will result in an excessive departure delay and the pilot indicates that he will accept a VFR restriction. To reduce communications and expedite departures wherever possible, pilots should include in their requests for departure clearances a statement that they will accept a VFR restriction either during climb to cruising altitude or to a specified altitude.

INABILITY TO COMPLY WITH ATC CLEARANCE: The pilot should always advise air traffic control when his aircraft is not equipped or its performance is insufficient to comply with an issued air traffic control clearance. A brief reason such as "unable account loads" or "unable transmit 3023.5" may be included if considered necessary for clarification. The pilot may then expect an amended air traffic control clearance.

ALBUQUERQUE ADIZ DELETED: The Albuquerque ADIZ will be deleted effective December 1, 1956. All references to the Albuquerque ADIZ will be deleted from Part 620, Regulations of the Administrator for the Security Control of Air Traffic, effective December 1, 1956.

NEWARK ATCS CHANGES: Effective 1600E November 13, 1956, all functions and services of the Newark, N. J. ATCS were transferred to and consolidated with the New York ATCS, CAA Operations Building, New York International Airport, Jamaica, N.Y. Voice broadcast, monitoring and cntrol of the Newark LF radio range will be performed by New York Radio, Idlewild. One-stop briefing service with private line flight plan telephone to Idlewild will be available at the Newark Airport Weather Station briefing counter for pilots. In addition the present Newark ATCS business telephone MArket 2-0121 will be provided with direct Idlewild extension for flight plan filing in Newark and the surrounding area.

ARTC CONTROL AREA AND FLIGHT ADVISORY BOUNDARIES: The following advisory and control area boundaries have been revised:

CHICAGO-DETROIT Flight Advisory/Control Area Boundary:

Beginning at a point on the southern edge of Civil Airway Red 12, 40 s mi ENE of the Goshen, Ind. omnirng at lat 41-48-30, long. 85-21-00.

Thence, northward to the northern edge of Civil Arwy V-10 to a point 50 s mi NE of the South Bend, Ind. omnirng, forming the control area boundary on Civil Arwys Red 12 and V-10.

Thence, westward along the northern edge of Civil Airway V-10 to the eastern edge of Civil Arwy Blue 3 and northward along the eastern edge of Civil Arwy Blue 3 to the southern edge of the Keeler-Jackson Victor Arwy (possibly V-116), forming the control area boundary on Civil Arwy Red 100.

Thence, westward along the southern edge of Keeler-Jackson Victor Arwy (possibly V-116), to a point 12 s mi SE of the Keeler, Mich. omnirng, forming the control area boundary on Civil Arwy Blue 3.

Thence, via an arc 12 s mi E from the Keeler, Mich., omnirng to the northern edge of the Keeler-Lansing proposed Victor Arwy, forming the control area boundary on the proposed Keeler-Jackson (possibly V-116) and Keeler-Lansing Victor Arwys.

Thence, southwestward along the northern edge of the Keeler-Lansing proposed Victor Arwy to and westward along the northern edge of the proposed Keeler-Wheeling Victor Arwy to a point 20 s mi SSW of the Pullman, Mich., omnirng, forming the control area boundary on Civil Arwys V-55 and Blue 6.

Thence, via an arc 20 s mi W of the Pullman, Mich., omnirng to a point on the northern edge of Civil Arwys V30 and Red 57, forming the control area boundary on Civil Arwys Red 28, Red 57, V-30, V-30S, and the proposed Wheeling-Pullman Victor Arwy.

Thence, along the present control area boundary 25 s mi W of the Muskegon, Mich., omnirng.

KANSAS CITY-DENVER and KANSAS CITY-MINNEAPOLIS Boundaries:

Beginning at a point on the northern edge of Civil Arwys V-6N/V8N, 25 s mi E of the Grand Island, Nebr., omnirng stn.

Thence, northward, direct to a point at longitude 98° W and latitude 43° N, forming the Kansas City-Denver control boundary on Civil Arwy V-100.

Thence, eastward to a point 45 s mi S of the Sioux Falls, S. Dak., omnirng stn on the western edge of Civil Arwy Amber 4.

Thence, via an arc 45 s mi S of the Sioux Falls, S. Dak. omnirng stn, forming the Kansas City-Minneapolis control area boundary on Civil Arwys Amber 4, V-15 and V-15E.

Thence, southeastward to a point 25 s mi SW of the Mason City, Iowa, omnirng stn and via an arc forming the Kansas City-Minneapolis control area boundary on Civil Arwys V-13W, V-13, V-13E and V-67.

Thence, via an arc 36 s mi N to E of the Waterloo, Iowa, omnirng stn, forming the Kansas City-Minneapolis and Kansas City-Chicago control area boundaries on Civil Arwys V-161 and V-100.

Thence, direct to a point on the northern edge of Civil Arwy V-172, 80 s mi E of the Des Moines, Iowa, omnirng stn, the present Kansas City-Chicago control boundary.

✓ ON-REQUEST REPORTING POINTS: The following on-request reporting points are renamed, designated, redesignated or cancelled and shall become effective as indicated:

RENAMED: Effective December 13, 1956:

LAKE PARK, WIS. (VHF) INTSXN - (Formerly "Maitland" Intsxn) - the intsxn of the 102°T radial of the Milwaukee, Wis. VOR and the back course of the Milwaukee, Wis. ILS lclzr.

DESIGNATED: Effective December 10, 1956:

NEWARK LMM, N. J. (VHF) INTSXN - the intsxn of the 139°T radial of the Caldwell, N. J. VOR and the SW course of the Newark, N. J. ILS lclzr.

REDESIGNATED: Effective December 13, 1956:

CHICAMAUGA, TENN. (VHF) INTSXN - the intsxn of the S course of the Lovell ILS lclzr and the 229°T radial of the Chattanooga, Tenn. VOR.

CANCELLED: Effective December 10, 1956:

AMBOY, N. J. (VHF) INTSXN - the intsxn of the Allentown, Pa. VOR direct radial to the Scotland, N. J. Rbn and SW course of the Newark, N. J. ILS lclzr.

WOODBRIDGE, N. J. (VHF) INTSXN - the intsxn of the 352° mag radial of the Colts Neck, VOR and the SW course of the Newark, N. J. ILS lclzr.

✓ NON-STANDARD HOLDING PATTERNS: The following non-standard holding patterns are designated or cancelled and shall become effective as indicated:

DESIGNATED: Effective December 13, 1956:

DENTON, TEX. (VHF) INTSXN - direction of holding - SE on 305°T radial of the Dallas, Tex. VOR; direction of turns - RIGHT; time - one minute; minimum altitude - 2000'.

PT. DUME, CALIF. (VHF) INTSXN - direction of holding - N on 163°T radial of the Fillmore, Calif. VOR; direction of turns - LEFT; time - one minute; minimum altitude - 4000'.

Effective December 10, 1956:

NEWARK, N. J. LMM(VHF)- direction of holding - SW on Newark, N. J. ILS lclzr; direction of turns - LEFT; time - one minute.

NEWARK, N. J. LMM (LF) - direction of holding - SW on Newark, N. J. ILS lclzr; direction of turns - LEFT; time - one minute.

CANCELLED: Effective December 10, 1956:

NEWARK, N. J. LFR - direction of holding - SW; direction of turns - RIGHT; time - one minute.

✓ AIRMAN'S GUIDE CORRECTIONS: Correct Airman's Guide, Volume 11, No. 18, dated November 13, 1956, as follows:

VOR RECEIVER CHECK SIGNALS

Provisions are being made to provide pilots with a means of checking the accuracy of VOR receivers to insure satisfactory operations of the airborne system. These provisions consist of three different methods: (a) a radiated test signal consisting of a signal radial; (b) certified check points on the airport surface; or (c) certified airborne check points. The radiated test signal is used by tuning the receiver to the published frequency of the test facility. With the flight path deviation indicator(FPDI) centered, the omnibearing selector should read 0° with the to-from indication being "From"; or the omnibearing selector should read 180° with the to-from indication reading "To". Should the VOR receiver be of the automatic indicating type the indication should be 180°. (This is true for all airborne receivers except Mitchell which will indicate 0°). Two means of identification are used with the VOR radiated test signal. In some cases, a continuous series of dots is used while in others a continuous 1020 cycle tone will identify the test signal. Information as to identification of an indivisual test signal can be obtained from the local control tower. Ground and airborne check points consist of certified radials that should be received at specific points on the airport surface or over specific landmarks while airborne in the immediate vicinity of the airport. Pilots are requested to contact control tower, communication station or airport manager for location details. Should an error in excess of +4° be indicated through use of the ground check or ± 6° using the airborne check, IFR flight should not be attempted without first correcting the source of error. CAUTION, no correction other than the "correction card" figures supplied by the manufacturer should be applied in making these VOR receiver checks. As of this date check points or facilities have been established at the following airports (listed under city name).

Attention, Pilots!

CHECK YOUR AERONAUTICAL CHARTS AND MAKE SURE THAT EACH OF THE OBSTRUCTIONS LISTED BELOW IS CARRIED! IF ANY ARE MISSING, INSERT THEM NOW, DON'T DELAY! ONLY YOU CAN MARK YOUR CHARTS: IT IS YOUR RESPONSIBILITY!

This list covers recent obstructions (television towers, smoke stacks, etc) which are 500 feet or more above the ground. It will be carried in the Airman's Guide at frequent intervals. When the list does not appear in the Guide, all new obstructions will be carried as two-starred items in the NOTAMS. The list will be brought up to date each time it is issued; newly added or changed material will be indicated by arrows.

The Coast and Geodetic Survey sectional charts show all known dangerous obstructions at the time a particular chart is issued. As these charts are published at intervals of six months to a year, dangerous obstructions built during the interim between issues must be placed on the charts by the user. The position, height and top elevation above MSL of these new obstructions can be taken from the list given below. New obstructions will be carried in this list until six months after the issuance of the sectional charts depicting the obstruction data and then deleted.

SPECIAL NOTICES

✓ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the General Services Office, Attention: W-120 (formerly W-52), CAA, Washington 25, D. C.

Permanent airport data changes should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman s Guide

---

CIVIL USE OF MILITARY FIELDS: U. S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission.

In the case of Air Force Bases, pilots must have on file with Headquarters USAF a "HOLD HARMLESS" AF form 180 and in their possession a properly signed and executed AF form 181 permit. Application for these forms may be made to: Assistant Chief of Staff, Installations, HQ, USAF, Washington 25, D. C. This regulation will be strictly enforced.

For Naval Installations, prior permission should be requested from the Chief of Naval Operations (OP 532) via the Commanding Officer of the field concerned, (who has the authority to approve landing rights for certain categories of civil aircraft). However, with minor exceptions, authority to use Navy field is granted only to aircraft on government business, or when no suitable civil airport is available in the vicinity.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations. The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shut down, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical locations. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert for these apparent vagaries.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations).

Omniranges where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification:

e.g. Long Beach omnirange (Voice) .-.. .- -.-. ... (LGB in Code)

For omniranges, as shown above, normal voice identification consists of the name of the omni followed by the word "omni". However, if the omni is unattended, i.e. if no facility for providing air-ground communications services is associated with the omni the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciable higher rate of speed than the location identifier.

INTERFERENCE ON INSACS COMMUNICATIONS CHANNELS: If excessive interference is noted on INSACS VFR or UHF simplex frequencies, pilots should request the INSACS to reply on the VOR voice channel. (Reference to the Air Navigation Radio Aids Section will indicate which VORs have a voice channel). This will often expedite the exchange of messages as the VOR has a clear channel for communications.

FLIGHT IN RESTRICTED AREA: Pilots are responsible for obtaining an approval from the appropriate controlling agency prior to conducting flight in Restricted Areas, when governing restrictions are in effect. ATC is unable, because of communications workload and other factors, to obtain such approval for pilots. An ATC clearance should not be considered as authority to conduct flight in Restricted Areas EXCEPT where a control area overlays a Restricted Area as ATC has responsibility only within controlled airspace.

NOMENCLATURE CHANGES FOR INSACS AND OFACS: Effective immediately the following nomenclature changes are in effect:

"Interstate Airway Communications Station" (INSACS) will be replaced by "Air Traffic Communications Station" (ATCS).

"Overseas-Foreign Aeronautical Communications Station" (OFACS) will be replaced by "International Air Traffic Communications Station" (IATCS).

Since the new abbreviations are not phonetic, the short terms "Station" and "International Station" may be used when referring to these facilities.

FLIGHT PLANS: Pilots are urged to file VFR flight plans in person or by telephone prior to departure. Radio should be used for filing flight plans only when it is impossible to file in person or by telephone. This procedure is necessary in order to avoid congestion on the already busy air-ground communications channels. These channels should be reserved for essential in-flight communications. All pilots will benefit by following this practice.

DVFR FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

RUNWAY VISUAL RANGE REPORTS AT NEWARK, N. J.: Effective March 3, 1956, measurements of runway visibility for Runway 4 at Newark, New Jersey, will be in terms of Runway Visual Range which is the distance high intensity runway lights can be seen by an observer located at the runway threshold viewing the lights in the same direction as a pilot making an approach.

The ILS and PAR instrument approach procedures for Newark will be amended to authorize 2600' of runway visual range as an additional operating minimum for straight-in approaches to Runway 4. When measurements of Runway Visual Range are being taken, the tower will give pilots intending to land straight-in on runway 4, the reported Runway Visual Range. When the meteorological ceiling and visibility (contained in "main body" of sequence report which is the average weather for the airport proper) are reported below minimums, (e.g. 200, 5), an approach may be conducted to Runway 4 provided Runway Visual Range is reported at or above 2600'. The "remarks" portion of the hourly weather sequence for Newark will report Runway Visual Range in hundreds of feet, and runway visibility will no longer be reported in miles and fraction.

Since Runway Visual Range recognizes the additional penetration provided by high intensity runway lights and is measured in terms of what a pilot actually sees, pilots will have better assurance of finding runway conditions substantially as reported when arriving over the threshold.

The Runway Visual Range minimum of 2600' is also based on the penetration ability of the approach lighting system installed at Newark which is designed to assure earlier transition from instrument to visual flight.

GLIDE SLOPE FLARE: Modification of null reference glide slope facilities will result in glide slope flare at about thirty (30) feet above runway. Caution advised on automatic approaches continued past runway threshold.

POSITION REPORTING PROCEDURE FOR IFR FLIGHTS OPERATING AT LEAST 1000 FEET ON TOP: Effective September 15, 1956, IFR flights cleared by ATC to operate at least 1000 feet on top shall conform to the following position reporting procedures:

1. Flights along airways. Regardless of the altitude being flown, pilots shall report only over those fixes that are designated as compulsory reporting points for all altitudes. ATC may specify additional reports as required.
2. Flights operating on a direct route. Regardless of the altitude being flown, pilots shall report over each reporting point specified in the flight plan (approximately 200 miles apart) and over each fix along the route designated as a compulsory reporting point for all altitudes. ATC may specify additional reports as required.

Pilots filing direct route flight plans requesting an altitude of at least 1000 feet on top should designate the route flight by appropriate fixes approximately 200 miles apart over which they plan to report.

IFR RATE OF CLIMB OR DESCENT: In the interest of standardizing operating procedures for IFR flight and to provide greater utilization of available airspace, pilots are requested to adhere to the following procedure when cleared by air traffic control to climb or descend in excess of 1000 feet to an approved altitude:

1. Unless cleared otherwise by air traffic control, climb as rapidly as practicable to 1000 feet below the assigned altitude and then not to exceed 500 feet per minute until the assigned altitude is reached.
2. Unless cleared otherwise by air traffic control, descend as rapidly as practicable to 1000 feet above the assigned altitude and then not to exceed 500 feet per minute until the assigned altitude is reached.

ATC DEPARTURE CLEARANCES: Effective November 1, 1956, air traffic controllers will discontinue issuing departure clearances specifying that any portion of the departure shall be conducted in "VFR conditions" unless provision of positive separation will result in an excessive departure delay and the pilot indicates that he will accept a VFR restriction. To reduce communications and expedite departures wherever possible, pilots should include in their requests for departure clearances a statement that they will accept a VFR restriction either during climb to cruising altitude or to a specified altitude.

INABILITY TO COMPLY WITH ATC CLEARANCE: The pilot should always advise air traffic control when his aircraft is not equipped or its performance is insufficient to comply with an issued air traffic control clearance. A brief reason such as "unable account loads" or "unable transmit 3023.5" may be included if considered necessary for clarification. The pilot may then expect an amended air traffic control clearance.

ALBUQUERQUE ADIZ DELETED: The Albuquerque ADIZ was deleted effective December 1, 1956. All references to the Albuquerque ADIZ will be deleted from Part 620, Regulations of the Administrator for the Security Control of Air Traffic, effective December 1, 1956.

✓ DISCONTINUANCE OF AIRWAYS BEACONS: Effective December 21, 1956, the following beacons in Region Four are discontinued:

✓ RESTRICTED AREA AMENDMENTS: The following Restricted Area Amendments shall become effective as indicated:

(Part 608 - Restricted Areas - Amendment 182)
(January 10, 1956)

(1) In Section 608.62, a Bonham, Territory of Hawaii Restricted Area (R-509), is added to read: "Description by Geographical Coordinates: Beginning at lat 22-12-45N, long. 159-43-00W; thence to lat 22-09-20N, long. 159-43-00W; thence counterclockwise along the shoreline of the Island of Kauai, Territory of Hawaii to lat 21-58-00N, long. 159-43-00W; thence to lat 21-55-00N, long. 159-43-00W; thence clockwise along a line 3 nautical miles from the shoreline of the Island of Kauai, Territory of Hawaii to lat 22-12-45N, long. 159-43-00W; the point of beginning. Designated Altitudes: Surface to 5000 ft MSL. Time of Designation: Continuous. Controlling Agency: COMFAIR, Hawaii".

(2) In Section 608.61, the Fairbanks, Alaska, area (R-345 formerly D-345), amended on December 19, 1953 in 18 F.R. 8567 is further amended by changing the "Controlling Agency" column to read: "Alaska Air Command, Elmendorf AFB, Alaska".

(3) In Section 608.61, the Big Delta, Alaska, area (R-346), amended on October 31, 1951 in 16 F.R. 11066 is further amended by changing the "Controlling Agency" column to read: "Arctic Test Branch, Army Field Forces, Fort Greely, Alaska".

(Part 608 - Restricted Areas - Amendment 183)
(January 1 thru March 31, 1957)

(1) In Section 608.31, the Grand Marais, Minnesota, Temporary Area (R-187A) is added to read: "Description by Geographical Coordinates: From lat 47-26-00, long. 90-53-00; to lat 47-04-00, long. 90-35-00; to lat 47-28-00, long. 89-30-00; to lat 47-50-00, long. 89-48-00; to point of beginning. Designated Altitudes: Surface to 50,000 feet MSL. Time of Designation: Day and Night. Controlling Agency: 31st Air Division (Defense) St. Paul, Minn." NOTE: This area only to be used during VFR weather conditions.

✓ AIRMAN'S GUIDE DATE TO BE CHANGED FOR HOLIDAYS: Because of the Christmas Holidays, the Guide scheduled for December 25 will be issued on December 21. Information to be included in this issue should reach the CAA (Attn: W-120) by December 19 or 20, if possible.

ALWAYS CHECK NOTICES TO AIRMEN SECTION

ATCS = Air Traffic Communications Station (CAA)

VHF OMNI-RANGE: "Non-commissioned" VHF omni-ranges may lack certain items, such as monitoring or control equipment or may not have been flight-checked and are subject to shut-down at any time without notice. The courses may or may not be within the prescribed tolerances and the station is to be used accordingly.

VAR AND VOR MONITORING CLASSIFICATION FOR AIR TRAFFIC CONTROL PURPOSES:

Category I (VAR) = Following conditions must be met: (A) The visual course alignment and signal level are monitored continuously. (B) The aural "A" or "N" sector signal is monitored continuously by the communicator at the associated ATCS. (C) The station identification is monitored continuously by the communicator at the associated ATCS. (D) The aural course alignment is monitored at least once each hour by the communicator at the associated ATCS. Category I VOR = Course alignment and signal level are monitored continuously. NOTE: Category I indicated by parenthetical (1). Category II (VAR only) = If all except (D) of the conditions of Category I are met. NOTE: Category II indicated by parenthetical (2). Category III = Facility monitored solely through use of automatic visual course and signal level monitor with automatic transfer unit. This category may permit VOR to be inoperative for a limited period before a notice to airmen is issued. Normally, VHF ranges which are not controlled by an ATCS, and located too distant from ATCS to be monitored with a VHF receiver will fall into Category III. NOTE: Category III indicated by parenthetical (3).

NOTE: Letters between range courses are quadrant identifiers, e.g., "90 YN 180", indicates the quadrant between the two courses is a yellow N quadrant. The letter immediately following a range course indicates whether the course is aural or visual, i.e., "Y" or "B", for yellow or blue, indicates visual: "A" or "N" aural. In the case of low frequency ranges, the A or N cited between two courses is the identification to be heard in the quadrant between those two courses.

RADIO CLASS DESIGNATIONS

AC	Approach Control Tower, CAA (transmits on voice channel of associated ranges and ILS in addition to frequencies listed)
B	Scheduled Broadcast Station (broadcasts weather at 15 and 45 minutes after the hour; Air Force Broadcasts, generally, 29 minutes)
C	Control Tower, CAA
CT	Control Tower, (City, County, Private, etc.)
D	Distantly controlled

DME	Distance Measuring Equipment
FM	VHF fan marker (100 watts)
GCA	Ground Controlled approach system
H	Non-directional radio beacon (homing), power 50 watts to less than 2000 watts
HH	Non-directional radio beacon (homing), power 2000 watts or more
ILS	Instrument Landing System (voice on localizer channel)
J	L/MF (200-415 kc) voice facility on other than range frequency
LFM	VHF fan marker, low powered (5 watts)
LMM	Compass locator station when installed at middle marker site
LOM	Compass locator when installed at outer marker site
LVOR	Low power VOR (with standby equipment)
MH	Non-directional radio beacon (homing) power less than 50 watts
ML	Range (loop radiators), power less than 50 watts
MM	VHF middle marker
MOR	Low frequency omni-directional range
MRA	Range (adcock, vertical radiators), power 50 or more, but less than 150 watts
MRL	Range (loop radiators), power 50 or more, but less than 150 watts
OM	VHF outer marker
P	Point-to-Point radio
RA	Range (adcock, vertical radiators), power 150 watts or more
RAPCON	Radar Approach Control Center.
RL	Range (loop radiators), power 150 watts or more
S	Simultaneous range, homing signals and voice.
T	Teletype
TASR	Terminal Area Surveillance Radar
TVOR	Low power VOR (no standby equipment) located on airport
TX	Principal teletype
V	Additional VHF voice feature on other than range frequency
VAR	Visual-aural VHF range
VOR	VHF omni-directional range (omni-range)
W	Without voice facilities on range frequency
Z	VHF station location marker at a range station

NOTES

1. Range courses are magnetic in-bearings
2. All CAA MH facilities operate continuously unless cited as follows: (on req)
3. All CAA ranges operate continuously. Those which are not manned continuously are cited in the remarks column with hours of operation in parentheses, e.g., (0600-2400)
4. VHF and LF/LMF ranges listed with the same identifier are controlled by the same ATCS. Due to space limitations the DTV and communication frequencies which are listed with the LF/LMF facility are not repeated with the VOR facility

Pilots are requested to indicate when calling C.A.A. airway communications stations and control towers the frequency on which the reply is expected.

PAR = Precision Approach Radar. Equivalent of Combined [illegible]
Approach - Military Equivalent of Combined [illegible]
Surveillance Radar. RAPCON = Radar Approach Control Center

GROUND CONTROLLED APPROACHES - The only airborne equipment required for ground controlled approaches is a functioning radio transmitter and receiver. There are two types of ground controlled approaches - Precision and Surveillance.

PRECISION APPROACHES - Aircraft are guided to final approach to the designated instrument runway. The final approach flight path on a precision scope (PAR) is greatly expanded for increased accuracy and furnishes the controller with range, azimuth and altitude information. This permits the controller to accurately guide aircraft to touchdown on the runway.

SURVEILLANCE or ASR APPROACHES - Only the ASR scope is used and aircraft may be directed to any selected runway over approximately the same flight path the pilot would take if flying VFR. This scope furnishes range and azimuth information only. Since no altitude information is available to the controller, pilots must control their descent based on the glide angle desired, and the distance from the runway as furnished by the controller. Because ASR does not permit the same degree of accuracy as PAR, the weather minimums for a surveillance approach are usually higher than for a precision approach.

RADAR ARRIVAL AND DEPARTURE CONTROL - Radar is utilized by certain radar equipped facilities to control the flight paths of arriving or departing IFR aircraft for the purpose of expediting the flow of traffic. Aircraft operating on IFR flight plans will be afforded a minimum of three miles horizontal separation unless standard non-radar vertical, lateral or longitudinal separation exists. This should not be confused with Ground Controlled Approach (GCA) which is an instrument approach aid

CAA RADAR UNITS - Operate continuously at the locations listed. Available to all pilots, civil and military. Contact associated CAA control tower on any frequency guarded for initial instructions, or in an emergency any CAA facility for information on nearest Radar Control. Weather minimums, associated runways and GCA procedures are listed in the Airman's Guide.

AIR FORCE [illegible] facility.
with G.C. of respective facility.
Contact under IFR: Pilots desiring GCA assistance during [illegible] with the nearest [illegible] traffic control facility (radio, airways, or tower, etc.) requesting GCA and further instructions.
Contact under VFR: VFR check-out of training flights should be arranged locally through Base Operations or the Control Tower.
Emergency: When receiver or transmitter difficulties exist, the tower may relay GCA approach instructions to the pilot, or the GCA operator may transmit, in blind, instructions for aircraft to make 360 degree turns for identification. In either case, instructions will be followed at the pilot's discretion.
After being inoperative, GCA units require 20 to 30 minutes for warming up. Pilots should anticipate requirements for GCA in flight planning and request alerting of GCA units as far in advance as possible
Civil Minimums at military installations established by the CAA are 400' ceiling and 1 statute mile visibility except in emergency, unless Air Force or Navy facility being used has higher minimums. Navy units are prepared to transmit on HF from 2,000 to 18,000 kc and receive any frequency from 1,500 to 9,050 kc to aid any plane in emergency.

RADAR FLIGHT ADVISORY SERVICE: If radar advisory service is desired, the pilot of an aircraft will request such service through the appropriate Air Route Traffic Control Center, using normal en route communications facilities. ARTC will determine if service can be provided and will request pilot to change to appropriate frequency for direct communication with radar. Radar station will be identified by "THIS IS AIR FORCE RADAR ADVISORY". All suggested vectors to circumnavigate storm areas will be of advisory nature and do not relieve pilot of responsibility for safety of aircraft. If advisory service cannot be furnished for any reason, the procedure word "UNABLE" will be used. This will terminate radar advisory service to the aircraft without further explanation. This service will be available in the following ARTC Flight Advisory Areas; Chicago, St. Louis, Minneapolis, Kansas City, Albuquerque, San Antonio, Ft. Worth, Oakland, Denver, Great Falls, Los Angeles, and the area immediately around Knoxville, Tenn.

NOTE: Transmitting frequencies below 118 mc. are not guarded. Other transmitting frequencies listed are guarded plus 122.5 mc. and 3023.5 kc. Transmit and guard 121.5 mc. all locations.

ILS localizer identifier is preceded by International Morse Code "I" (two dots). Time interval between the "I" designator and the first letter of the assigned characteristic will be 0.6 second. *-Automatic voice identification. **-Distance from markers to approach end ILS runway. NOTE: The service area of compass locators is 15 miles.
(L5) - Instrument Approach (neon) (L7) - Hi-intensity Approach Lights. W - Without voice. BC - Back course BC-restricted = Not suitable for approaches

DIRECTORY OF AIRPORTS – LEGEND

CITY AND AIRPORT NAME

(AF) City and Airport Name (with L or P in Type Column) - a civil airport with Air Force operations, reserve training, or other such activity thereon.

NOTE: Similar combinations of above citation of A,N,CG, and NG indicate the same is applicable for Army, Navy, Coast Guard, and National Guard fields, respectively.

(P) City and Airport Name - Civil Airport covered by an agreement between municipality and U.S. Government which permits use by transient military aircraft.

(PC) Same legal status as (P), but closed to all USAF pilots not possessing their own clearance authority in accordance with AFR 60-16.

NOTES:

1. Where lights are owned or maintained by CAA the site number and airway abbreviation are included in the city and airport name column ie: Chadron, 15, CYS-HON.

2. USAF aircraft are permitted to use only those fields prefixed with an AF, A, N, NG, CG, P, PC.

3. When city and airport names are identical, the airport name is omitted to conserve space.

4. When city is part of airport name, a dash will appear between city and airport, such as Venice-State.

TYPE

P Public Use L - Limited

NOTES

PUBLIC USE - Intended for general use by the public at large, this category consists of:

(1) Operationally active airports (those attended during normal working hours of each day, and provide, as a minimum of service, aircraft fuel for sale at the airport).

(2) All airports serving scheduled and large irregular air carriers as regular, alternate and provisional stops.

(3) All CAA intermediate landing fields.

(4) All airports having a true light certificate to indicate a lighted airport.

Data on these airports are obtained from physical inspections made by CAA personnel.

LIMITED - All airports not qualifying as "Public Use" (See definition above)

LOCATION

The word "miles" has been eliminated because of space limitations. Mileage is from the center of referenced city to airport and carried in statute miles.

ALWAYS CHECK NOTICES TO AIRMEN SECTION

LOCATION (Continued)

If orientation features are less than 1/2 mile from the field, distance is not specified.

ELEVATION

Elevation is given in feet above mean sea level and is based on highest usable portion of landing area.

NUMBER OF RUNWAYS

No differentiation is made between runways and strips as far as number of landing areas in field is concerned.

LONGEST RUNWAY AND FACILITIES

In this column are included the length and surfacing of the longest runway, the lighting and servicing facilities, weather reports, and unicom available.

RUNWAYS

The length of the longest paved runway or non-paved strip is stated in hundreds of feet, using 70 as division point. If the length is not prefixed, the surface is sod, clay, gravel, etc.

h -runway is paved (concrete, asphalt or similar type of paving)

aw -allway field

(26) -runway or strip length not verified by C.A.A.

LIGHTS

B: Rotating Light (Rotating beacon)
(Green and white, split-beam and other types)
Omission of B indicates rotating light is either not available or not operating standard hours (sunset-sunrise)

NOTE: Code lights are not codified, and are carried in Remarks Column.

L: Field Lighting

L - by itself indicates temporary lighting, such as flares, smudge pots, lanterns.
1 - Portable lights (Electrical)
2 - Boundary
3 - Runway floods
4 - Runway or Strip
5 - Instrument approach (neon)
6 - High intensity runway
7 - High intensity instrument approach

✱ An asterisk preceding an element indicates that it operates on prior request only (by phone call, telegram or letter). Where the asterisk is not shown, the lights are in operation or available sunset to sunrise by request (circling the field or radio call).

Because the obstructions on virtually all lighted fields are obstruction lighted, obstruction lights have not been included in the codification.

SERVICING

S1: Storage
S2: Storage, minor aircraft repairs
S3: Storage, minor aircraft, and minor engine repairs
S4: Storage, major aircraft, and minor engine repairs
S5: Storage, major aircraft, and major engine repairs

NOTE: Any S combination without parenthesis indicates only full-time day attendant. Fields having lighting facilities may have 24 hours attendant available
Any S combination in parenthesis-part time or irregular attendant.

WEATHER

W: Weather reports available from Weather Bureau or CAA communications station on field.

UNICOM

U: Unicom (Aero Advisory Station transmitting and receiving on 122.8 mc). Operates during airport hours only

FUEL OCTANE

F1: 80 oct., at least
F2: 80/87 oct., and lower
F3: 91/96 oct., and lower
F4: 100/130 oct., and lower

NOTE: If only one octane available, this octane cited, and not coded.
Any F combination without parenthesis indicates full time day attendant, in parenthesis part-time or irregular attendant.

REMARKS

(a) "INACTIVE" indicates usable civil field, but not being operated, at last inspection. Caution advised.

(b) "CLOSED" indicates closed to all traffic except in emergency.

(c) "ABANDONED" indicates reverted to non-airport usage such as farming or grazing.

(d) "REPORTED ABANDONED" indicates an airport reported abandoned but not verified as such by C.A.A.

(e) "FEE" indicates landing charges for private or non-revenue producing aircraft. In addition, fees may be charged for planes that remain over a couple of hours and buy no services, or at major airline terminals for all aircraft.

(f) "Blkd" indicates approaches where glide angle to runway is 3:1 or less.

(g) "Rct tfc N" indicates right turns should be made on landings and take-offs to N.

NOTES

1. ← New or revised data.
2. SCHEDULED AIRLINE STOP: Airport names are capitalized.
3. OBSTRUCTIONS: Because of space limitations only the more dangerous obstructions are indicated. Natural obstructions, like trees, for example, clearly discernible for contact operations, are frequently omitted. On the other hand, all pole lines within at least 15:1 glide angle are indicated.
4. NEW AIRPORTS: At the end of each state, under this listing will be found, out of alphabetical alignment, all the new airports tabulated after the type for that state had been originally set up.

NOTICES TO AIRMEN

SPECIAL NOTICES

✓ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the General Services Office, Attention: W-120 (formerly W-52), CAA, Washington 25, D. C.

Permanent airport data changes should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman's Guide

---

CIVIL USE OF MILITARY FIELDS: U. S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission.

In the case of Air Force Bases, pilots must have on file with Headquarters USAF a "HOLD HARMLESS" AF form 180 and in their possession a properly signed and executed AF form 181 permit. Application for these forms may be made to: Assistant Chief of Staff, Installations, HQ, USAF, Washington 25, D. C. This regulation will be strictly enforced.

For Naval Installations, prior permission should be requested from the Chief of Naval Operations (OP 532) via the Commanding Officer of the field concerned, (who has the authority to approve landing rights for certain categories of civil aircraft). However, with minor exceptions, authority to use Navy field is granted only to aircraft on government business, or when no suitable civil airport is available in the vicinity.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations. The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shut down, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical locations. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert for these apparent vagaries.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations).

Omniranges where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification:

e.g. Long Beach omnirange (Voice) .-.. . -... -.-. (LGB in Code)

For omniranges, as shown above, normal voice identification consists of the name of the omni followed by the word "omni". However, if the omni is unattended, i.e. if no facility for providing air-ground communications services is associated with the omni the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciable higher rate of speed than the location identifier.

INTERFERENCE ON INSACS COMMUNICATIONS CHANNELS: If excessive interference is noted on INSACS VFR or UHF simplex frequencies, pilots should request the INSACS to reply on the VOR voice channel. (Reference to the Air Navigation Radio Aids Section will indicate which VORs have a voice channel). This will often expedite the exchange of messages as the VOR has a clear channel for communications.

FLIGHT IN RESTRICTED AREA: Pilots are responsible for obtaining an approval from the appropriate controlling agency prior to conducting flight in Restricted Areas, when governing restrictions are in effect. ATC is unable, because of communications workload and other factors, to obtain such approval for pilots. An ATC clearance should not be considered as authority to conduct flight in Restricted Areas EXCEPT where a control area overlays a Restricted Area as ATC has responsibility only within controlled airspace.

NOMENCLATURE CHANGES FOR INSACS AND OFACS: Effective immediately the following nomenclature changes are in effect:

"Interstate Airway Communications Station" (INSACS) will be replaced by "Air Traffic Communications Station" (ATCS).

"Overseas-Foreign Aeronautical Communications Station" (OFACS) will be replaced by "International Air Traffic Communications Station" (IATCS).

Since the new abbreviations are not phonetic, the short terms "Station" and "International Station" may be used when referring to these facilities.

FLIGHT PLANS: Pilots are urged to file VFR flight plans in person or by telephone prior to departure. Radio should be used for filing flight plans only when it is impossible to file in person or by telephone. This procedure is necessary in order to avoid congestion on the already busy air-ground communications channels. These channels should be reserved for essential in-flight communications. All pilots will benefit by following this practice.

DVFR FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

(21 Dec 1956)

RUNWAY VISUAL RANGE REPORTS AT NEWARK, N. J.: Effective March 1, 1956 measurements of runway visibility for Runway 4 at Newark, New Jersey, will be in terms of Runway Visual Range which is the distance high intensity runway lights can be seen by an observer located at the runway threshold viewing the lights in the same direction as a pilot making an approach.

The ILS and PAR instrument approach procedures for Newark will be amended to authorize 2600' of runway visual range as an additional operating minimum for straight-in approaches to Runway 4. When measurements of Runway Visual Range are being taken, the tower will give pilots intending to land straight-in on runway 4, the reported Runway Visual Range. When the meteorological ceiling and visibility (contained in "main body" of sequence report which is the average weather for the airport proper) are reported below minimums, (e.g. 200.5), an approach may be conducted to Runway 4 provided Runway Visual Range is reported at or above 2600'. The "remarks" portion of the hourly weather sequence for Newark will report Runway Visual Range in hundreds of feet, and runway visibility will no longer be reported in miles and fraction.

Since Runway Visual Range recognizes the additional penetration provided by high intensity runway lights and is measured in terms of what a pilot actually sees, pilots will have better assurance of finding runway conditions substantially as reported when arriving over the threshold.

The Runway Visual Range minimum of 2600' is also based on the penetration ability of the approach lighting system installed at Newark which is designed to assure earlier transition from instrument to visual flight.

GLIDE SLOPE FLARE: Modification of null reference glide slope facilities will result in glide slope flare at about thirty (30) feet above runway. Caution advised on automatic approaches continued past runway threshold.

POSITION REPORTING PROCEDURE FOR IFR FLIGHTS OPERATING AT LEAST 1000 FEET ON TOP: Effective September 15, 1956, IFR flights cleared by ATC to operate at least 1000 feet on top shall conform to the following position reporting procedures:

1. Flights along airways. Regardless of the altitude being flown, pilots shall report only over those fixes that are designated as compulsory reporting points for all altitudes. ATC may specify additional reports as required.

2. Flights operating on a direct route. Regardless of the altitude being flown, pilots shall report over each reporting point specified in the flight plan (approximately 200 miles apart) and over each fix along the route designated as a compulsory reporting point for all altitudes. ATC may specify additional reports as required.

Pilots filing direct route flight plans requesting an altitude of at least 1000 feet on top should designate the route flight by appropriate fixes approximately 200 miles apart over which they plan to report.

IFR RATE OF CLIMB OR DESCENT: In the interest of standardizing operating procedures for IFR flight and to provide greater utilization of available airspace, pilots are requested to adhere to the following procedure when cleared by air traffic control to climb or descend in excess of 1000 feet to an approved altitude:

1. Unless cleared otherwise by air traffic control, climb as rapidly as practicable to 1000 feet below the assigned altitude and then not to exceed 500 feet per minute until the assigned altitude is reached.

2. Unless cleared otherwise by air traffic control, descend as rapidly as practicable to 1000 feet above the assigned altitude and then not to exceed 500 feet per minute until the assigned altitude is reached.

ATC DEPARTURE CLEARANCES: Effective November 1, 1956, air traffic controllers will discontinue issuing departure clearances specifying that any portion of the departure shall be conducted in "VFR conditions" unless provision of positive separation will result in an excessive departure delay and the pilot indicates that he will accept a VFR restriction. To reduce communications and expedite departures wherever possible, pilots should include in their requests for departure clearances a statement that they will accept a VFR restriction either during climb to cruising altitude or to a specified altitude.

INABILITY TO COMPLY WITH ATC CLEARANCE: The pilot should always advise air traffic control when his aircraft is not equipped or its performance is insufficient to comply with an issued air traffic control clearance. A brief reason such as "unable account loads" or "unable transmit 3023.5" may be included if considered necessary for clarification. The pilot may then expect an amended air traffic control clearance.

✓ REGULATIONS OF THE ADMINISTRATOR, PART 620, SECURITY CONTROL OF AIR TRAFFIC AMENDED: Effective January 1, 1957, Part 620, is being relaxed considerably. Generally speaking, air traffic which originates within the Air Defense Identification Zones and follows a course away from the two Defense Areas and any traffic which leaves the United States will no longer be obliged to abide by the security rules. This relaxation, together with the deletion of the Albuquerque ADIZ on December 1, 1956, exempts over half of the air traffic previously required to observe these rules. In addition to the general exemption of "outbound traffic", the Northern ADIZ west of the 121° Meridian has been deleted. The designation of a Security Identification Zone in this area by Canada has made this change possible.

The actual changes to Part 620 are as follows: Amend 620.10 by changing the word "and" to "an".

Amend subdivisions (i) through (iv) of 620.13 (c) (2) to read as follows:

(c) Areas or routes excepted -- *** (2) Continental United States.

(i) A flight originating within the Eastern or Western Defense Area which maintains an outbound track into or through a contiguous ADIZ.

(ii) A flight originating within the Eastern, Western or Presque Isle ADIZ which maintains an outbound track which will come no closer to the contiguous Defense Area than the point of origin.

(iii) A flight originating within the Northern ADIZ which maintains an outbound track toward or across the United States-Canadian Border.

(iv) A flight originating within or overflying the Central Open Area which maintains an outbound track into or through the Northern ADIZ or Southern Border ADIZ without penetrating the Eastern ADIZ or Western ADIZ toward the associated Defense Area.

Amend 620.21 (a) to read as follows:

620.21 Domestic ADIZ's

(a) Northern (Domestic) ADIZ. The area bounded by a line from the United States-Canadian Border at 121°00'W., eastward along the U.S.-Canadian Border to 47°10'N., 85°31'W.; 46°51'N., 94°00'W; 47°10'N., 96°17'W; 48°00'N., 99°00'W.; to 48°00'N., 121°00'W.; to U.S.-Canadian Border at 121°00'W. (point of beginning).

Attention, Pilots!

CHECK YOUR AERONAUTICAL CHARTS AND MAKE SURE THAT EACH OF THE OBSTRUCTIONS LISTED BELOW IS CARRIED!
IF ANY ARE MISSING, INSERT THEM NOW, DON'T DELAY! ONLY YOU CAN MARK YOUR CHARTS: IT IS YOUR RESPONSIBILITY!

This list covers recent obstructions (television towers, smoke stacks, etc) which are 500 feet or more above the ground. It will be carried in the Airman's Guide at frequent intervals. When the list does not appear in the Guide, all new obstructions will be carried as two-starred items in the NOTAMS. The list will be brought up to date each time it is issued; newly added or changed material will be indicated by arrows.

The Coast and Geodetic Survey sectional charts show all known dangerous obstructions at the time a particular chart is issued. As these charts are published at intervals of six months to a year, dangerous obstructions built during the interim between issues must be placed on the charts by the user. The position, height and top elevation above MSL of these new obstructions can be taken from the list given below. New obstructions will be carried in this list until six months after the issuance of the sectional charts depicting the obstruction data and then deleted.

VOR RECEIVER CHECK SIGNALS

Provisions are being made to provide pilots with a means of checking the accuracy of VOR receivers to insure satisfactory operations of the airborne system. These provisions consist of three different methods: (a) a radiated test signal consisting of a signal radial; (b) certified check points on the airport surface; or (c) certified airborne check points. The radiated test signal is used by tuning the receiver to the published frequency of the test facility. With the flight path deviation indicator(FPDI) centered, the omnibearing selector should read 0° with the to-from indication being "From"; or the omnibearing selector should read 180° with the to-from indication reading "To". Should the VOR receiver be of the automatic indicating type the indication should be 180°. (This is true for all airborne receivers except Mitchell which will indicate 0°). Two means of identification are used with the VOR radiated test signal. In some cases, a continuous series of dots is used while in others a continuous 1020 cycle tone will identify the test signal. Information as to identification of an indivisual test signal can be obtained from the local control tower. Ground and airborne check points consist of certified radials that thould be received at specific points on the airport surface or over specific landmarks while airborne in the immediate vicinity of the airport. Pilots are requested to contact control tower, communication station or airport manager for location details. Should an error in excess of +4° be indicated through use of the ground check or ± 6° using the airborne check, IFR flight should not be attempted without first correcting the source of error. CAUTION, no correction other than the "correction card" figures supplied by the manufacturer should be applied in making these VOR receiver checks. As of this date check points or facilities have been established at the following airports (listed under city name).

Revisions to Instrument Approach Procedures

NEW YORK INTERNATIONAL AIRPORT - Correct the following procedures, in last column(missed approach) by inserting "at 1500 feet" immediately after "130°": LFR #1(1Feb. 1954); ILS #1 (20 Oct. 1955); GCA #1 (17 Dec. 1955); TVOR-1, Amend. #1 (1 Mar. 1955); and TVOR-4, Amend. #1 (21 May 1955).

LOW FREQUENCY RANGE PROCEDURES

If an LFR instrument approach is conducted at the below named airport, it shall be in accordance with the following instrument approach procedure, unless an approach is conducted in accordance with a different procedure for such airport authorized by the Administrator of Civil Aeronautics. Initial approaches shall be made over specified routes. Minimum altitude (s) shall correspond with those established for en route operation in the particular area or as set forth below.

INSTRUMENT LANDING SYSTEM PROCEDURES

If an ILS instrument approach is conducted at the below named airport, it shall be in accordance with the following instrument approach procedure, unless an approach is conducted in accordance with a different procedure for such airport authorized by the Administrator of Civil Aeronautics. Initial approaches shall be made over specified routes. Minimum altitude (s) shall correspond with those established for en route operation in the particular area or as set forth below.

The AIRMAN'S GUIDE is issued every two weeks. This issue includes all data on record as of 0001 E.S.T. on the above date. For later information consult Teletype NOTAMS.

U. S. DEPARTMENT OF COMMERCE
CIVIL AERONAUTICS ADMINISTRATION
GENERAL SERVICES OFFICE

✓ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the General Services Office, Attention: W-120 (formerly W-52), CAA, Washington 25, D. C.

Permanent airport data changes should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman's Guide

---

CIVIL USE OF MILITARY FIELDS: U. S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission.

In the case of Air Force Bases, pilots must have on file with Headquarters USAF a "HOLD HARMLESS" AF form 180 and in their possession a properly signed and executed AF form 181 permit. Application for these forms may be made to: Assistant Chief of Staff, Installations, HQ, USAF, Washington 25, D. C. This regulation will be strictly enforced.

For Naval Installations, prior permission should be requested from the Chief of Naval Operations (OP 532) via the Commanding Officer of the field concerned, (who has the authority to approve landing rights for certain categories of civil aircraft). However, with minor exceptions, authority to use Navy field is granted only to aircraft on government business, or when no suitable civil airport is available in the vicinity.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations. The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shut down, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical locations. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert for these apparent vagaries.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations).

Omniranges where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification:

e.g. Long Beach omnirange (Voice) .-.. .- -.-. .--. (LGB in Code)

For omniranges, as shown above, normal voice identification consists of the name of the omni followed by the word "omni". However, if the omni is unattended, i.e. if no facility for providing air-ground communications services is associated with the omni the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciable higher rate of speed than the location identifier.

INTERFERENCE ON INSACS COMMUNICATIONS CHANNELS: If excessive interference is noted on INSACS VFR or UHF simplex frequencies, pilots should request the INSACS to reply on the VOR voice channel. (Reference to the Air Navigation Radio Aids Section will indicate which VORs have a voice channel). This will often expedite the exchange of messages as the VOR has a clear channel for communications.

FLIGHT IN RESTRICTED AREA: Pilots are responsible for obtaining an approval from the appropriate controlling agency prior to conducting flight in Restricted Areas, when governing restrictions are in effect. ATC is unable, because of communications workload and other factors, to obtain such approval for pilots. An ATC clearance should not be considered as authority to conduct flight in Restricted Areas EXCEPT where a control area overlays a Restricted Area as ATC has responsibility only within controlled airspace.

NOMENCLATURE CHANGES FOR INSACS AND OFACS: Effective immediately the following nomenclature changes are in effect:

"Interstate Airway Communications Station" (INSACS) will be replaced by "Air Traffic Communications Station" (ATCS).

"Overseas-Foreign Aeronautical Communications Station" (OFACS) will be replaced by "International Air Traffic Communications Station" (IATCS).

Since the new abbreviations are not phonetic, the short terms "Station" and "International Station" may be used when referring to these facilities.

FLIGHT PLANS: Pilots are urged to file VFR flight plans in person or by telephone prior to departure. Radio should be used for filing flight plans only when it is impossible to file in person or by telephone. This procedure is necessary in order to avoid congestion on the already busy air-ground communications channels. These channels should be reserved for essential in-flight communications. All pilots will benefit by following this practice.

DVFR FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

RUNWAY VISUAL RANGE REPORTS AT NEWARK, N. J.: Effective March 3, 1956, measurements of runway visibility for Runway 4 at Newark, New Jersey, will be in terms of Runway Visual Range which is the distance high intensity runway lights can be seen by an observer located at the runway threshold viewing the lights in the same direction as a pilot making an approach.

The ILS and PAR instrument approach procedures for Newark will be amended to authorize 2600' of runway visual range as an additional operating minimum for straight-in approaches to Runway 4. When measurements of Runway Visual Range are being taken, the tower will give pilots intending to land straight-in on runway 4, the reported Runway Visual Range. When the meteorological ceiling and visibility (contained in "main body" of sequence report which is the average weather for the airport proper) are reported below minimums, (e.g. 200-5), an approach may be conducted to Runway 4 provided Runway Visual Range is reported at or above 2600'. The "remarks" portion of the hourly weather sequence for Newark will report Runway Visual Range in hundreds of feet, and runway visibility will no longer be reported in miles and fraction.

Since Runway Visual Range recognizes the additional penetration provided by high intensity runway lights and is measured in terms of what a pilot actually sees, pilots will have better assurance of finding runway conditions substantially as reported when arriving over the threshold.

The Runway Visual Range minimum of 2600' is also based on the penetration ability of the approach lighting system installed at Newark which is designed to assure earlier transition from instrument to visual flight.

GLIDE SLOPE FLARE: Modification of null reference glide slope facilities will result in glide slope flare at about thirty (30) feet above runway. Caution advised on automatic approaches continued past runway threshold.

POSITION REPORTING PROCEDURE FOR IFR FLIGHTS OPERATING AT LEAST 1000 FEET ON TOP: Effective September 15, 1956, IFR flights cleared by ATC to operate at least 1000 feet on top shall conform to the following position reporting procedures:

1. Flights along airways. Regardless of the altitude being flown, pilots shall report only over those fixes that are designated as compulsory reporting points for all altitudes. ATC may specify additional reports as required.

2. Flights operating on a direct route. Regardless of the altitude being flown, pilots shall report over each reporting point specified in the flight plan (approximately 200 miles apart) and over each fix along the route designated as a compulsory reporting point for all altitudes. ATC may specify additional reports as required.

Pilots filing direct route flight plans requesting an altitude of at least 1000 feet on top should designate the route flight by appropriate fixes approximately 200 miles apart over which they plan to report.

IFR RATE OF CLIMB OR DESCENT: In the interest of standardizing operating procedures for IFR flight and to provide greater utilization of available airspace, pilots are requested to adhere to the following procedure when cleared by air traffic control to climb or descend in excess of 1000 feet to an approved altitude:

1. Unless cleared otherwise by air traffic control, climb as rapidly as practicable to 1000 feet below the assigned altitude and then not to exceed 500 feet per minute until the assigned altitude is reached.

2. Unless cleared otherwise by air traffic control, descend as rapidly as practicable to 1000 feet above the assigned altitude and then not to exceed 500 feet per minute until the assigned altitude is reached.

ATC DEPARTURE CLEARANCES: Effective November 1, 1956, air traffic controllers will discontinue issuing departure clearances specifying that any portion of the departure shall be conducted in "VFR conditions" unless provision of positive separation will result in an excessive departure delay and the pilot indicates that he will accept a VFR restriction. To reduce communications and expedite departures wherever possible, pilots should include in their requests for departure clearances a statement that they will accept a VFR restriction either during climb to cruising altitude or to a specified altitude.

INABILITY TO COMPLY WITH ATC CLEARANCE: The pilot should always advise air traffic control when his aircraft is not equipped or its performance is insufficient to comply with an issued air traffic control clearance. A brief reason such as "unable account loads" or "unable transmit 3023.5" may be included if considered necessary for clarification. The pilot may then expect an amended air traffic control clearance.
